come back if it never left, but we'll chalk that up to semantics.

background (no pun intended); although, some sources claim that

In fact, the best thing about gradient code is that it can be as simple or as complex as you'd like to make it. You can do the bare minimum and let the browser figure out the rest, or you can take things into your own hands and identify all the odds and ends. You could even do a little extra if you wanted and explore the endless possibilities of gradients.

Transitions in linear gradients occur along a straight line determined by an angle or direction. A CSS linear gradient can be coded by using the linear-gradient() function and can be as simple or complex as you would like. At the very least, you'll only need two colors to get started. From there, you could add more colors, angles, directions, and more to customize your gradient even further. CODE

If you leave the code at its most basic styling, the other will be determined automatically by the browser. This is direction or angle and color-stop positions. For more constyling, you can specify these values to create fun gradient multiple colors or angled directions. Playing with color-positions could also leave you with a solid pattern insteaditional gradient. The possibilities are endless!	ncludes the ustomized ients with stop
Compared to radial gradients, linear gradients are certa popular in design and branding techniques. For example	

their gradient branding recently. Linear gradients are, perhaps, the easiest way to incorporate this trend into your creations, as they seem to blend smoothly with other design elements. **Radial Gradients** A CSS radial gradient—although far less often seen—is just as beautiful and fun as a linear gradient and can be implemented just as easily. With that said, the code may seem more difficult to
